SIME DARBY PROPERTY • MEMBERS-FIRST PARKING

ParkFlow

Guaranteed access for members.
Better decisions for every driver.

A gated Priority Zone, deterministic booking control and whole-car-park forecasting—starting with a measured KL East Mall lighthouse.

Business case vNext • 5 November 2026

Approve a KL East lighthouse—not a national rollout

ParkFlow should be judged first as an SDP member-experience and operating-data business case. External commercialisation is an option earned by proof, not assumed revenue.

01

Prove the core

A gated Priority Zone uses observed entries, exits and protected reservations to accept or reject bookings deterministically.

02

Measure value

The pilot tests member adoption, fulfilment, repeat visits, utilization and operator decisions—without claiming unproven GTO uplift.

03

Scale one adjacency

Replicate only into SDP malls that pass a readiness screen; productise the playbook before considering external licensing.

RECOMMENDATION **SDP first → evidence first → portfolio second → venture option third**

GTM principle: customer-specific proof of value, repeatable expansion and explicit scale gates.

Parking certainty matters most when the visit matters most

KL East Mall has finite capacity; the commercial question is not whether ParkFlow creates bays, but whether it protects the experience of valuable repeat visitors while improving how the car park is operated.

1,300

parking bays at KL East Mall

200+

retail outlets across four levels

RM327

mean trip spend: frequent visitors

Malaysia survey, n=500

28%

spent RM300+ on latest trip

Malaysia survey, 2026

Member need

Know whether a guaranteed Priority Zone booking is available—and when to arrive if it is not.

Operator need

See demand, occupancy, turnover and exceptions early enough to direct traffic and deploy staff.

Sources: Sime Darby Property KL East Mall; Vase.ai Malaysia Shopping Mall Report 2026 (n=500, recalled behaviour).

Separate the guarantee from the forecast

LAYER 1 • CONTROL

Deterministic booking

- Entry and exit LPR verify the gated Priority Zone boundary
- Observed occupancy + protected reservations determine available-to-promise
- If capacity is unavailable, the answer is a hard no or another time
- The forecast never gambles with an accepted member booking

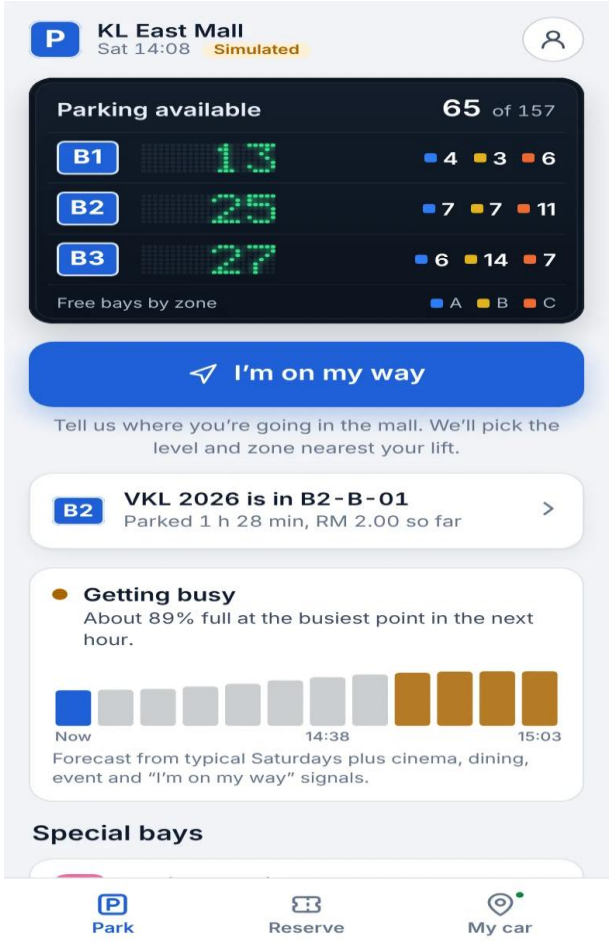

LAYER 2 • DECISION SUPPORT

Whole-car-park forecast

- Predicts likely availability by area and time—not only inside the Priority Zone
- Helps a member decide whether to book now, arrive later or use general parking
- Gives non-members broad level guidance to reduce circulation
- Gives the operator exact flows, confidence and exception alerts

GUARANTEE ≠ FORECAST

One decision, three useful outcomes

1

Check

The member sees Priority Zone status plus general-parking context.

2

Decide

Book a guaranteed window, choose a later slot, or use open parking.

3

Verify

The gated LPR boundary admits the registered plate and records exit.

Member privilege = guaranteed booking access. Public benefit = clearer guidance and less circulation.

Show each audience only the precision they need

NON-MEMBER

General guidance

- Current level availability
- Broad congestion bands
- Where to go now

No booking rights

MEMBER

Actionable access

- Priority Zone status
- Likely next opening
- Booking and alerts

Guaranteed booking rights

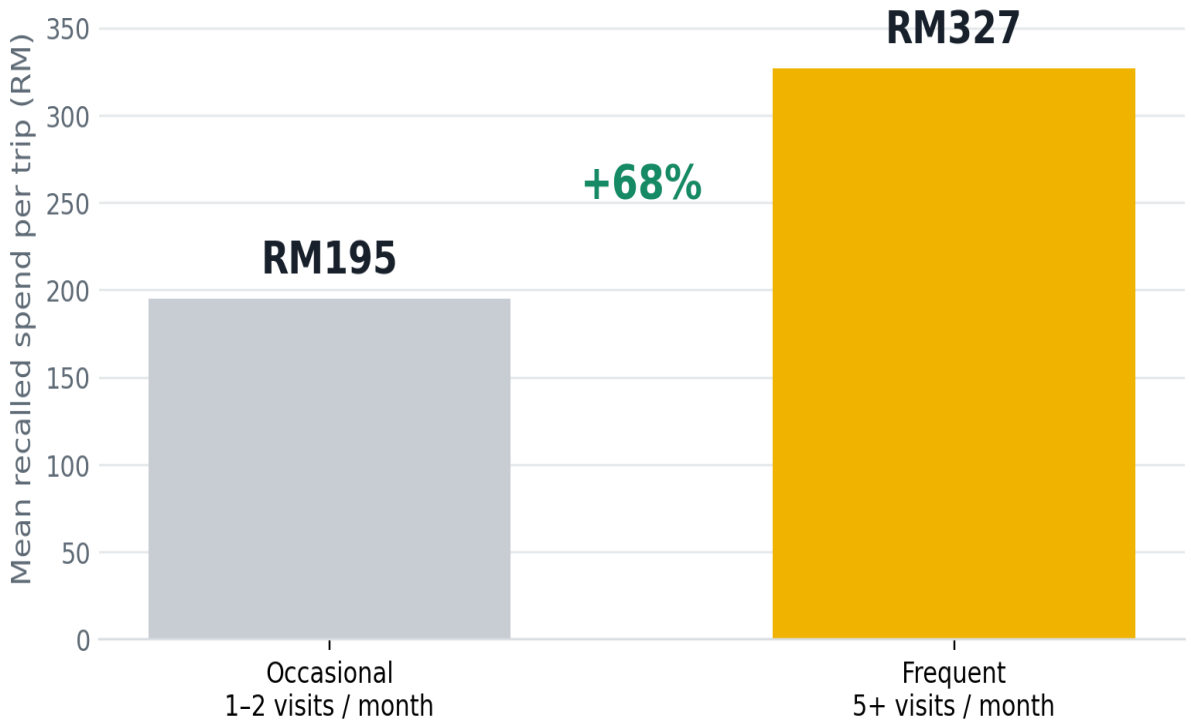

OPERATOR

Operational truth

- Exact counts and flows
- Forecast confidence
- Exceptions and interventions

Control and audit rights

The strongest signal is frequency—not a speculative parking fee

1 Utama ONECARD

RM20,000 + 100 transactions

Silver qualification over 12 months; members-only preferred parking exists.

The Gardens Club

Loyalty + parking privileges

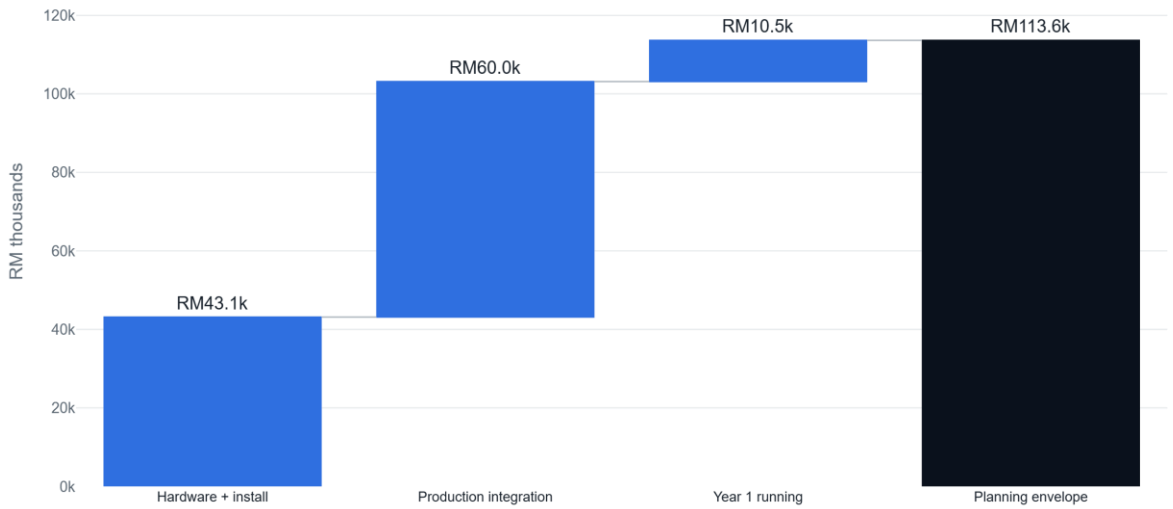

RM15,000 joining threshold; qualifying members receive spend-linked parking benefits.

What this proves **Valuable membership and parking privileges already coexist.**

Sources: Vase.ai 2026 (n=500); official ONECARD FAQ and Silver T&C; official The Gardens Club programme.

Finance the proof; do not capitalise the hypothesis

The approval case is a bounded pilot investment with explicit evidence gates. Retention and GTO are measured upside—not guaranteed cash flow.

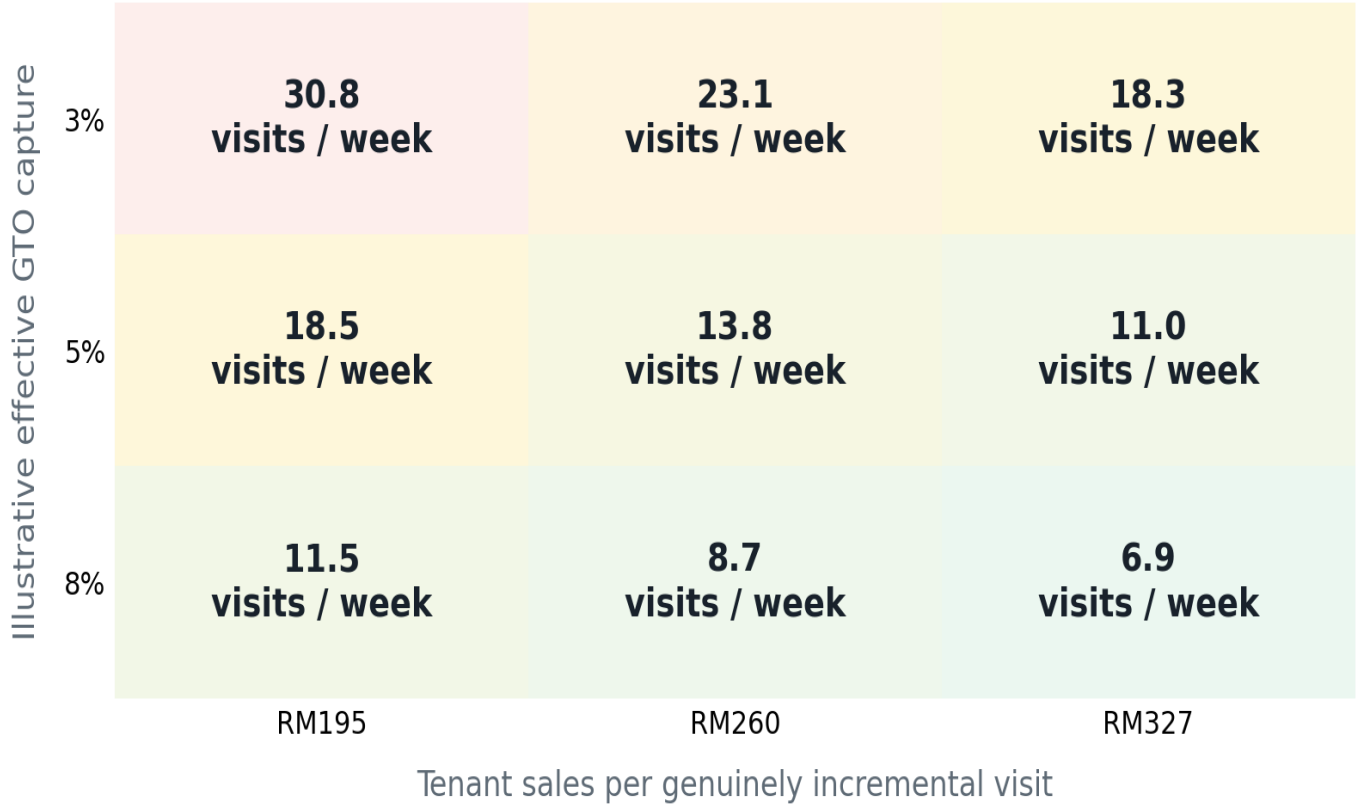

Midpoint planning case; ranges remain RM30k–58k hardware and RM45k–100k integration.

ILLUSTRATIVE VALUE BRIDGE

RM327	tenant sales / genuinely incremental visit
× 5%	assumed effective GTO capture
RM16.35	potential GTO value per incremental visit

Not yet proven: reservation → incremental visit; KL East GTO share; member retention effect; final vendor cost.

Make the retention threshold transparent

REFERENCE CASE

~11 visits / week

At RM327 sales and 5% illustrative capture, approximately 573 genuinely incremental visits per year correspond to RM9,360 potential GTO value.

This is a pilot hurdle—not a forecast.

Decision rule: report measured incremental visits and observed tenant sales; do not multiply every booking by a basket value.

The data product is operational control, not another dashboard

NOW — **Live truth**

Entries, exits, occupancy, bookings and exceptions by zone and level.

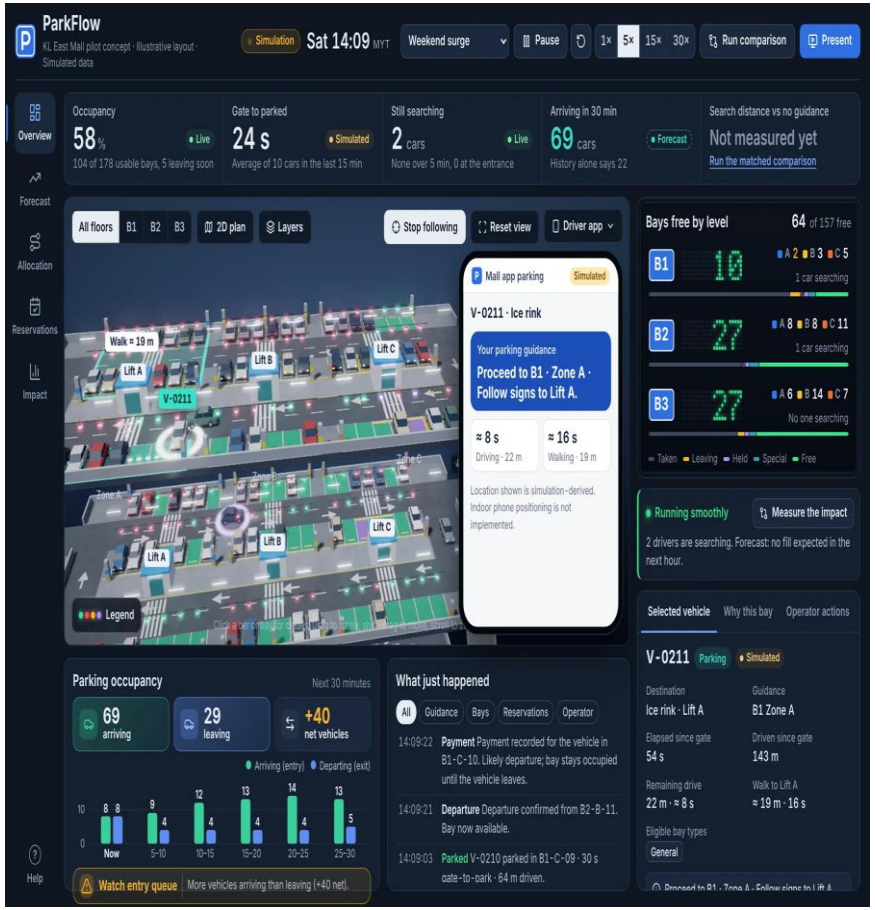

NEXT — **Forward warning**

Likely peaks, departures and confidence bands for staffing and signage.

LEARN — **Closed-loop improvement**

No-shows, dwell, interventions and fulfilment refine the operating rule.

Operator outcome: clearer staffing decisions and auditable service levels.

A gated enterprise adoption system—not a marketing funnel

1

LIGHTHOUSE

KL East

Deploy with the real operator, data and member workflow.

2

VALUE GATE

Measured proof

Pass technical, adoption, operational and commercial thresholds.

3

PORTFOLIO

Qualified SDP malls

Expand only where readiness and parking pressure justify it.

4

PRODUCTISE

Repeatable playbook

Standardise integrations, governance, training and support.

5

OPTION

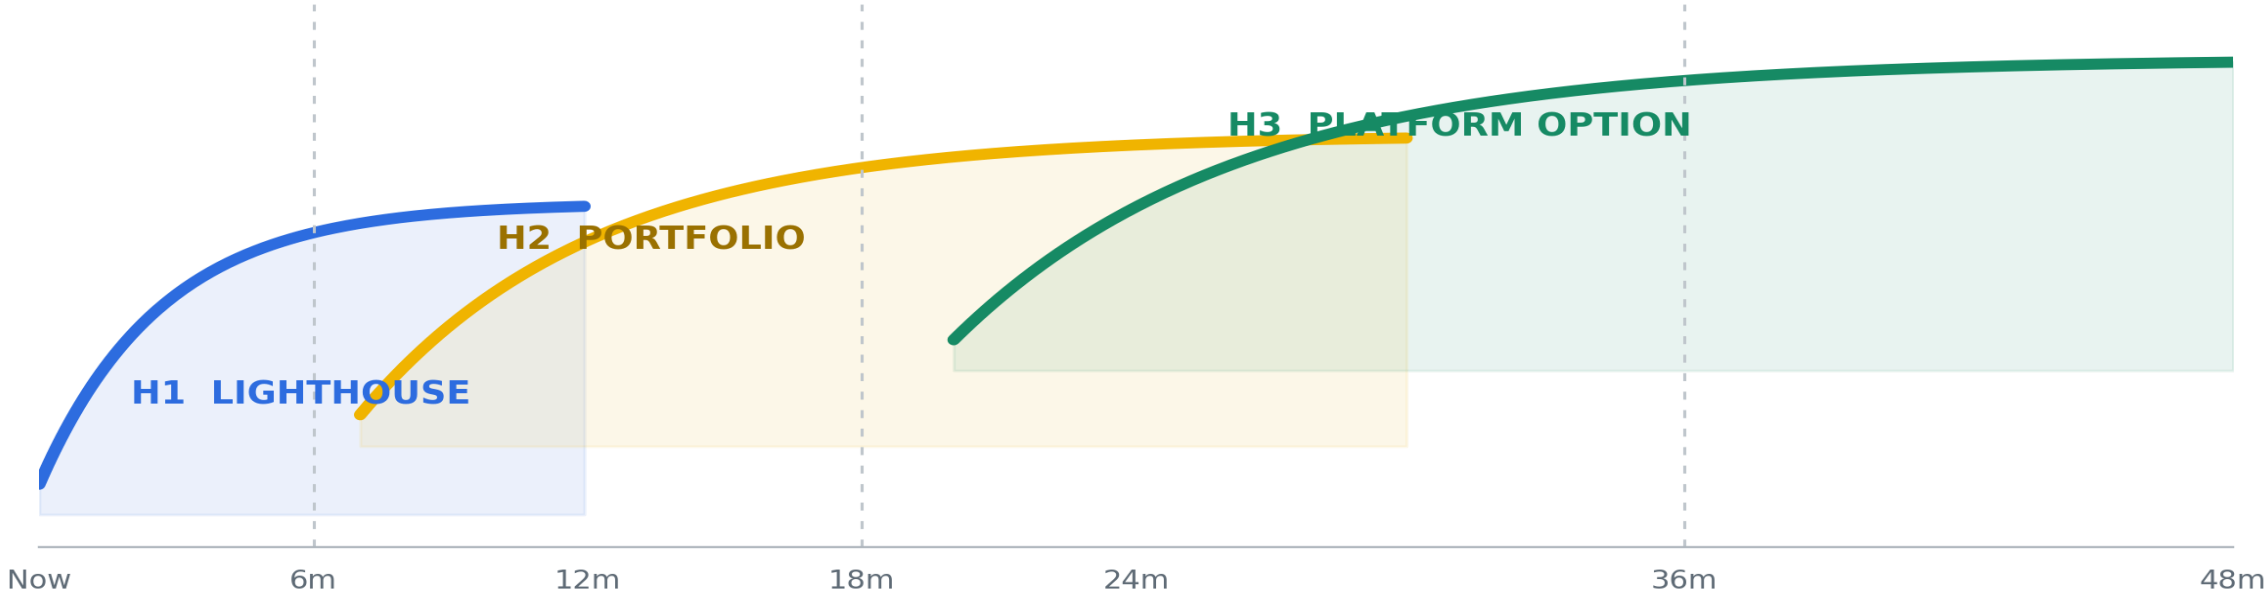

External scale

Choose internal, JV or licensed model after reference proof.

Buyer coalition: Mall GM • Parking operator • Loyalty/digital • IT & DPO • Finance

Framework adapted to ParkFlow from BCG proof-of-value, Bain repeatable models and HBR pilot-to-scale guidance.

Build the next option before the current horizon is complete

H1 • 0–6 months

Prove at KL East

Deterministic fulfilment, member adoption, operator value and data quality.

H2 • 6–24 months

Replicate in SDP

Readiness screen, loyalty integration and a standard operating playbook.

H3 • 24–48 months

Exercise the option

Productise for internal ownership, a JV or selective external licensing.

Keep ownership open until the evidence changes the answer

OPTION 1

SDP-owned capability

Highest control

SDP funds, operates and retains the data and capability.

Best if portfolio value dominates.

OPTION 2

Joint venture / managed service

Balanced

SDP anchors demand while a venture team builds and operates the platform.

Best if specialist execution is needed.

OPTION 3

Independent platform

Highest external upside

A standalone company licenses ParkFlow to SDP and other asset owners.

Only after repeatability is proven.

Recommended now: approve the lighthouse under SDP sponsorship; make ownership a Horizon 2 decision gate.

Approve a bounded proof with four non-negotiable gates

TECHNICAL

≥99%

accepted bookings fulfilled

ADOPTION

Target set

eligible members who book and return

OPERATIONS

Measured

utilization, flow and intervention improvement

ECONOMICS

Observed

incremental visits, tenant sales and cost per booking

THE ASK

Authorize site validation, vendor quotations and a KL East pilot design with agreed data access and success gates.

NO SCALE COMMITMENT

Horizon 2 begins only if the lighthouse passes.

Deterministic available-to-promise rule

AVAILABLE TO PROMISE

Zone capacity − vehicles inside − protected upcoming reservations − safety allowance

Entry / exit truth

Matched LPR events maintain boundary occupancy.

Reservation ledger

Each accepted arrival window consumes protected capacity until arrival or expiry.

Hard acceptance

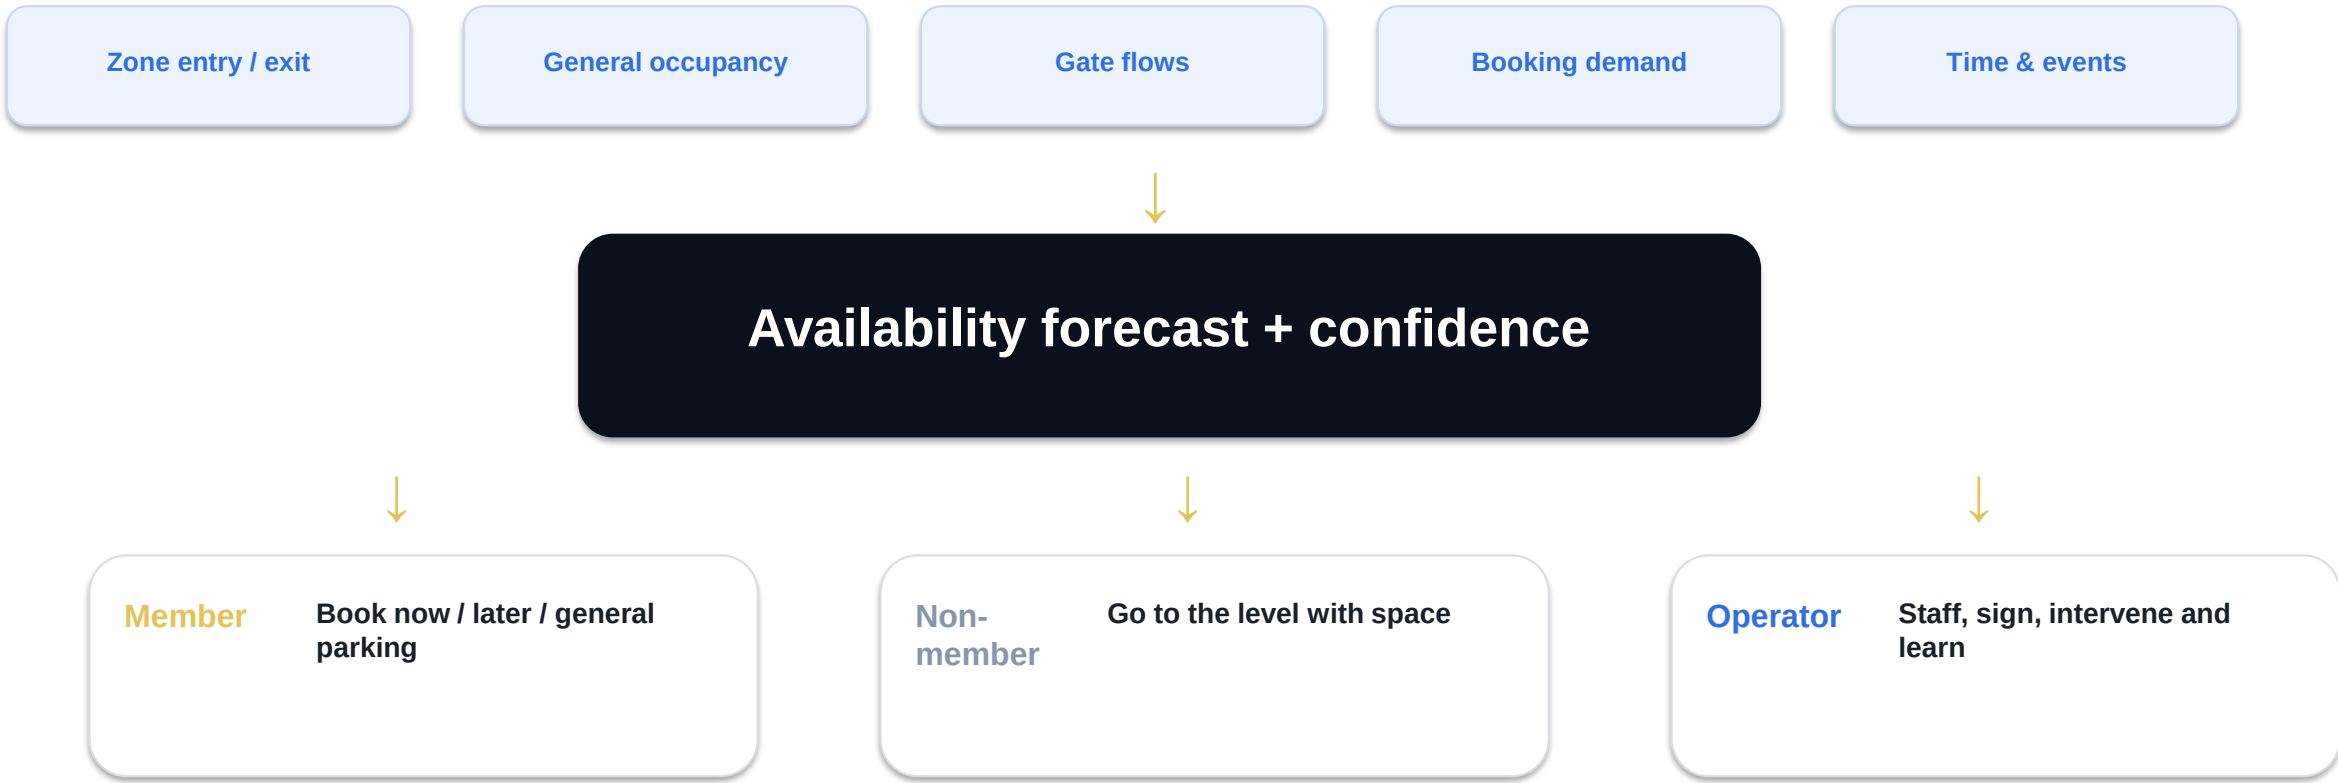

Accept only when capacity remains non-negative across the protected interval.

Forecast advisory

Prediction proposes likely future openings; it does not override the guarantee.

Final allowance and expiry rules require site geometry, operating policy and pilot calibration.

Forecasting supports decisions across the whole car park

Evidence register: what is supported and what remains a pilot question

SUPPORTED

- High-frequency Malaysian mall visitors report higher per-trip spend.
- Established mall programmes combine loyalty qualification and parking privileges.
- KL East Mall has 1,300 bays and more than 200 retail outlets.
- A gated LPR boundary can produce deterministic entry/exit observations.

TO VALIDATE

- Priority booking causes eligible members to visit more often.
- Incremental visits generate a specific GTO-rent outcome at KL East.
- Current cost estimates survive procurement and integration discovery.
- The operating model replicates economically across other SDP malls.

Portfolio expansion requires a readiness screen

01 Pressure

Measured peak occupancy and member pain

02 Geometry

A controllable Priority Zone boundary

03 Identity

Member and plate registration capability

04 Data

Reliable gate and occupancy observations

05 Operator

Contractual and operational participation

06 Economics

A site-specific cost and value case

No automatic four-mall rollout: each site must pass all six tests or receive a different intervention.

Selected sources and modelling notes

- Sime Darby Property — KL East Mall: 1,300 parking bays; 200+ retail outlets.
- Vase.ai, Malaysia Shopping Mall Report 2026 — n=500; mean recalled spend RM327 for 5+ visits/month vs RM195 for 1–2.
- 1 Utama ONECARD official FAQ and Silver T&C — member-only preferred parking; RM20,000 and 100-transaction Silver criteria.
- The Gardens Club official programme and T&C — qualified loyalty membership and spend-linked parking privileges.
- ParkFlow analysis scripts — forecast backtests and simulated zone operations; results are model evidence, not KL East field outcomes.
- BCG (2026) — customer-specific proof of value for enterprise software; Bain — disciplined one-step adjacency and repeatable models; HBR — design pilot replication before scale.

All financial outputs in this deck are planning scenarios unless labelled as verified external benchmarks.
